# Outline

---

- 강의 소개
- 평가
- 강의 진행 방식 및 규칙

# 강의 소개

---

- 창원대 신소재공학부 3학년 학부 대상
- 시간
  - 화 (52201) 9:00am – 10:15am
  - 목 (52201) 10:30am – 11:45am
- 15주

# 평가

---

- 등급 평가 (ABCDF)
- 중간 기말 고사
  - 학생의 이해도를 평가할 수 있는 '기술' 중심 문항
  - 전반적으로 수업 중 다루었던 내용을 주로 출제
  - 수업에서 다루었던 내용을 충분히 이해하여야 풀이할 수 있는 문항 포함
  - 중간 기말 고사에 국문 및 영문으로 출제
- 출결
  - 수업시작 10분까지 출석 인정
  - 10분-30분까지 지각
  - 30분- 결석
  - 총 수업의  $\frac{1}{4}$  이상 결석시 자동으로 F 학점

# Internal Policy

---

- 지각이란

- 교수자가 출석을 모두 부른 후 도착
- 수업 후 지각한 인원은 면담후 수정.

- 결석이란

- 수업 시작 시간을 30분 초과하여 나타나거나, no-show

- $\frac{1}{4}$  이상 결석시에 자동으로 F 학점 부여

- 평가

- 출결 (10%)

- 지각 (0.5 시간): 1회x 2% 차감
  - 결석 (1.5 시간): 1회x 3% 차감

- 과제 (20%)

- Mid-term (30%)
  - Final (40%)

- 강의자료

# 오늘의 강의 목표

---

- 각종 가공법의 종류와 장단점에 대한 이해
- 성형 가공법에 대한 이해
  - 분말 성형
  - 사출 성형
  - Additive manufacturing
- 소성 가공에 대한 이해
- 구성 방정식이란?
- 기계적 물성과 그와 관련된 물리량
  - 응력
  - 변형률

# Shaping & Forming

---

- Components in desired shape.
- How could we manufacture an item in desired shape made of a certain kind of material?

# 소성가공이란?

---

- 재료의 가공법의 종류; 물질의 소성을 활용한 가공; 본 강의는 금속에 한정
- 재료 가공법에는
  - 부가 가공 (additive manufacturing) – 3D printer
  - 제거 가공 (절삭, 절단)
  - 성형 가공 (**소성 가공**, 분말 성형, 사출 성형 등)
- Q. 분말 성형 (powder forming)?
- Q. 사출 성형 (injecting molding)?
- Q. 3D print?
- Q. 다양한 가공법이 존재하는 이유는?

# 분말 성형 (powder forming)

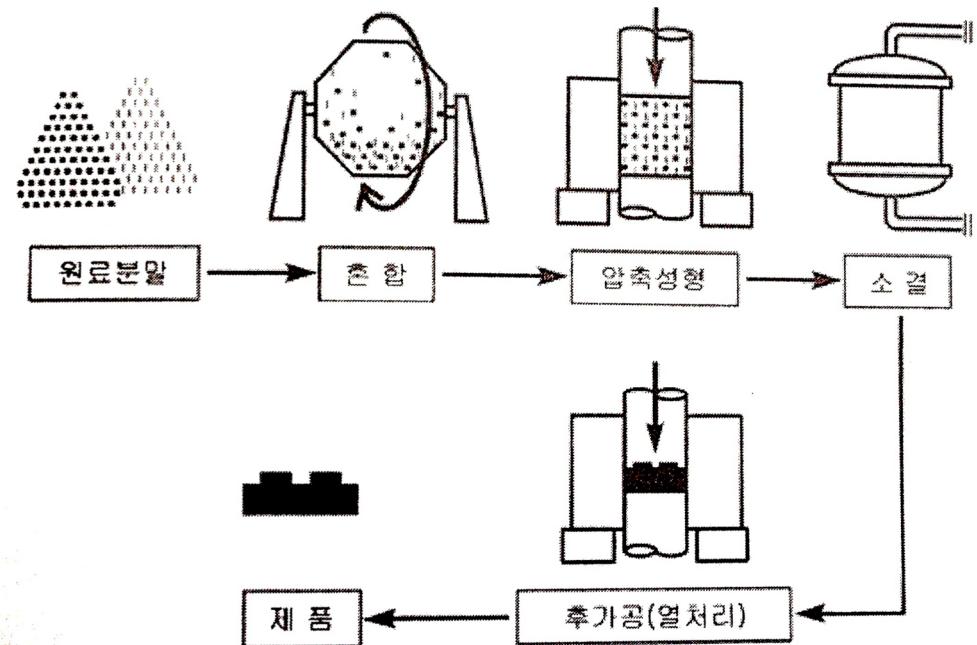

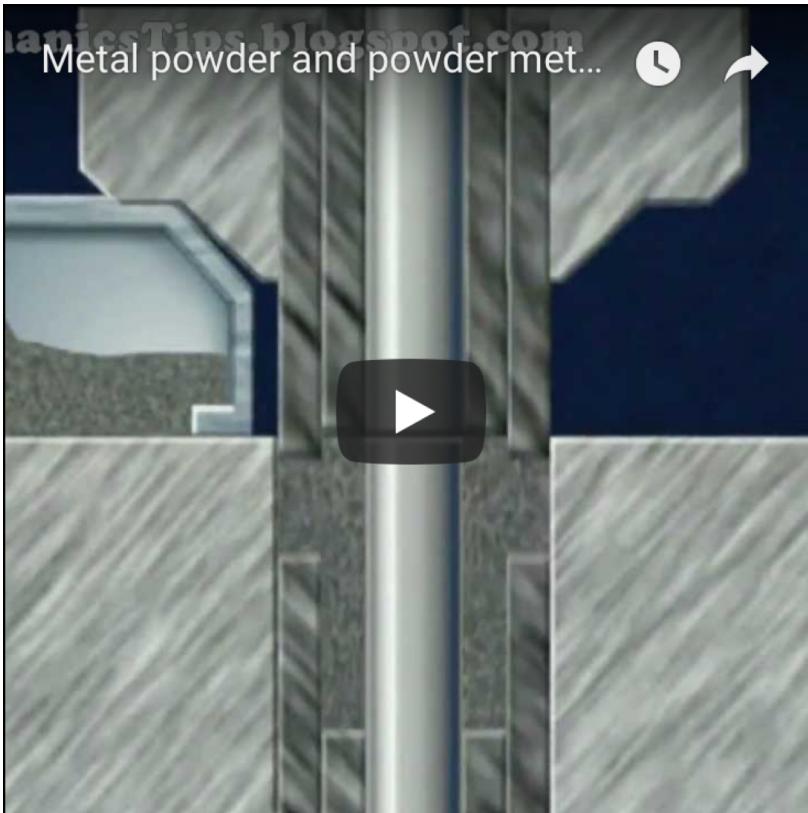

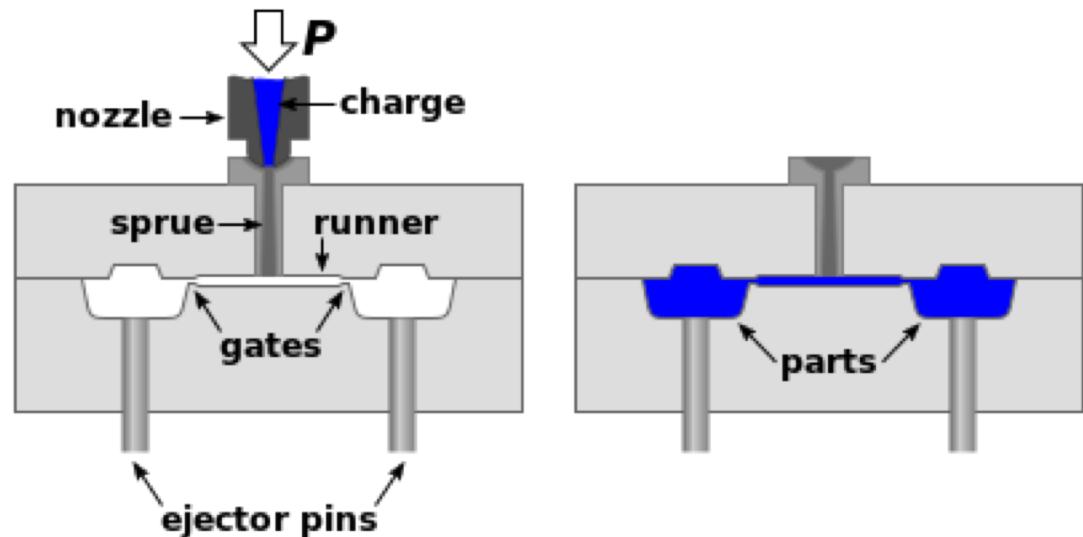

그림 4.2 분말성형의 일반적공정

- <https://youtu.be/O7U4HWjYcqo> 3:15
- 재료가공학 – 서영섭 p93

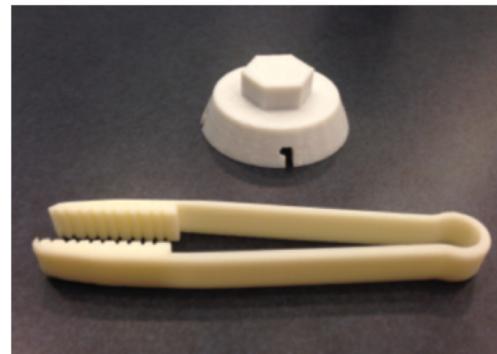

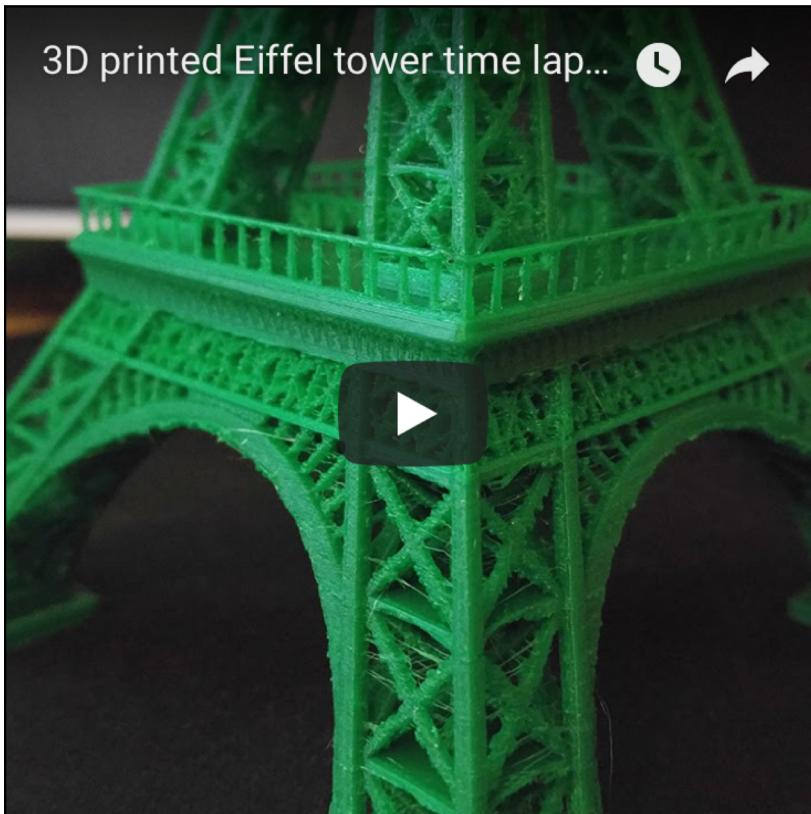

# 사출 성형 (injection molding)

## ■ Injection molding

<https://youtu.be/y1Zhpdx-XtA>

# Additive manufacturing (3D print)

The plastic tools above were printed with the Made In Space 3D printer and are representative of tools used by the space station crew.

Astronauts who pioneer the solar system and Mars will use additive manufacturing to print 3D supplies such as tools and equipment.

Q: 왜 NASA는 3D printer 연구에 관심이 있을까? Why does NASA study 3D printing technology?

<https://youtu.be/FqQAjkZOBeY>

[https://www.nasa.gov/sites/default/files/files/3D\\_Printing-v3.pdf](https://www.nasa.gov/sites/default/files/files/3D_Printing-v3.pdf)

# 소성 가공?

---

- 재료에 힘을 가해 원하는 형태로 가공하는 제조법. A manufacturing process in which external load is applied to the material to achieve the desired shape.
- Advantages:
  - 재료의 손실이 거의 없다 (no big loss of material).
  - 동일한 제품을 '대량'으로 생산하기에 적합 (adequate for mass production)
- Q1. 소성이란? What is plasticity?
- Q2. 탄성이란? What is elasticity?
- Q3. 소성가공의 단점?

# 소성 가공과 물성

---

- 기계적 물성
- Q. 기계적 물성이란?
- Q. 기계적 물성의 종류, 그리고 측정 방법
- Q. 물리량? 힘, 변형
- Q. 기계적 물성을 나타내기에 적합한 물리량이 무엇일까?

# 물성과 물리 법칙

---

- Q. intensive property (세기 성질)와 extensive property (크기 성질)을 설명할 수 있는가?
- Q. 크기에 의존하지 않은 물리량은 무엇이 있는가?
- 물성을 나타내기 위해서는 해당 물질의 ‘크기’ (혹은 무게, 부피)에 의존하지 않은 물리량 (physical quantity)을 사용한다.
- 많은 경우, 물리 법칙은 크기에 의존하지 않은 물리량들 관의 관계를 나타낸다.

# 응력 그리고 변형률

---

- Q. 왜 응력과 변형률을 배울까?
- Q. 한 물체가 가지는 응력과 변형률의 관계?
- 한 물체의 기계적 성질을 구성모델 (constitutive model)로 표현한다. 구성 모델은 물체에 작용한 응력에 대해 어떤 변형률로 반응이 나타나는지 표현해낸다 (혹은 vice versa). 많은 자연의 법칙이 그렇듯이 '수학'이라는 언어로 표현한다.
- 금속이 가지는 기계적 성질은 구성 모델로 표현되고, 그 구성 모델들은 '수학'이라는 '언어'로 쓰여져 있다.
- 앞으로 몇주간 금속의 기계적 성질을 표현하는데 가장 중요한 두 물리량, 응력(stress)과 변형률(strain)에 대해서 집중적으로 살펴본다.

# Example: elasticity of metals

---

- In the elastic regime for a metal, the mechanical property can be understood by looking at the relationship between strain and stress. Notice that both strain and stresses are ‘intensive’ properties. The physical rule governed in this elastic reason is often called Hooke’s law, which shows that stress and strain is ‘linearly’ correlated.
- What is the constitutive law in this example?
- Does elasticity mean the linearity between stress and strain?

# 창원과 소성 가공

- 창원의 지역 특수성
- 지난 8월 8일 삼우공업 방문:
  - 다양한 Titanium 합금 소재 성형 솔루션이 필요.
  - 합금 소재의 기계적 물성을 이해하는 전문성을 갖춘 인재가 필요.

# 최신 소성 가공 연구 동향

---

- 기계, 자동차, 군수 등 다양한 제조 산업 업체
- 소성 가공 커뮤니티에서의 최신 연구 동향에 따르면 기계 및 열적 물성을 총체적으로 고려한 솔루션이 널리 요구되고 있다.
- 또한 컴퓨터를 활용한 예측 시뮬레이션의 개발과 이용이 날로 확장되고 있다.
- 과거에 소성가공은 기계 전공이 주였다면 현재는 복잡해지는 금속 소재의 특성을 이해하는 재료 전문 분야로 확장중.
- 지난 10년간 나의 연구 주제: 금속 소재의 미세 구조 (microstructure)가 물질의 기계적 물성에 끼치는 영향 파악. 그 반대로 (an inverse approach), 특정 기계적 물성을 향상시키기 위해서 어떤 미세 구조를 가져야 하는가?

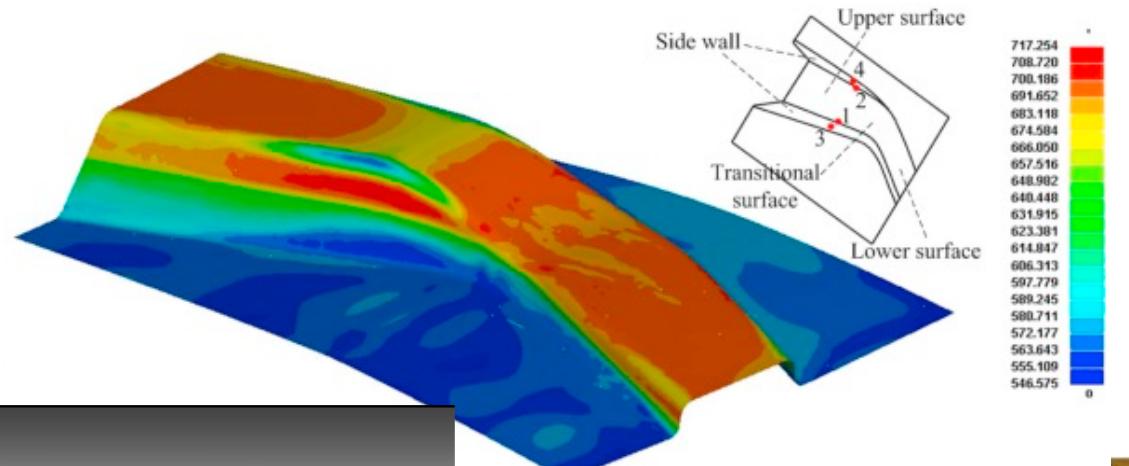

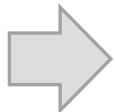

# 최신 소성 가공 연구 동향

- 향후 연구주제: 버튼 하나로 제공되는 재료 맞춤형 소성 가공 예측 프로그램 개발

Tuning microstructure

Grain size, CRSS  
control,  
crystallographic  
texture, single  
crystal structure,  
dislocation density

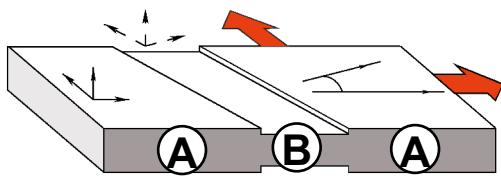

Chang et al., Applied Thermal Engineering 99, 25, 2016 p419-428

# 금속 판재의 성형성 측정과 예측

## 성형성 예측 모델의 개발 과정

구성방정식 개발  
(하중/변형 관계 규명)

$$\dot{\epsilon} = \dot{\gamma}_0 \sum_s \mathbf{m}^s \left( \frac{\mathbf{m}^s : \boldsymbol{\sigma}}{\tau_c^s} \right)^n \operatorname{sgn}(\mathbf{m}^s : \boldsymbol{\sigma})$$

$$L_{ij}^{(A)} = c \cdot \begin{bmatrix} 1 & L_{12}^{(A)}/c & 0 \\ 0 & \rho & 0 \\ 0 & 0 & -(\rho + 1) \end{bmatrix} \mathbf{e}_i^{\text{lab}} \otimes \mathbf{e}_j^{\text{lab}}$$

물성 모델 개발에서의  
다양한 접근법 가능

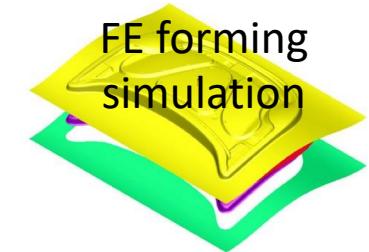

컴퓨터 SW 개발  
(User Material / FE)

현상학적 모델  
(Phen. Model)

미세구조기반  
미세역학모델

수치해석

- 상대적으로 빠른 전산 속도
- Macro 기계물성 (예: R-value, Yield stress ...)

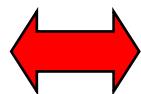

- 상대적으로 느린 전산 속도
- Micro 기계물성 (예: slip/twin system, texture ...)

# Microstructural parameters, Properties

---

## Properties

- Strength
- Toughness
- Conductivity
- Corrosion Resistance
- Piezoelectric strain
- Dielectric constant
- Magnetic Permeability
- **Formability**

## Microstructural Parameters

- Grain size
- Grain shape
- Phase structure
- Composite structure
- Chemical composition (alloying)
- Crystal structure
- Defect structure (e.g. porosity)

# Microstructural parameters, Properties

- Yes, when we study the plasticity of metals, we now should consider the microstructure of the material of interest
- Q. What is microstructure?
- A. Microstructure = internal structure

*Biology was revolutionized when Leeuwenhoek and others started to use **microscopes** to look at the internal structure of plants. They were able to relate many characteristics of plants to their cell structure, for example.*

Similarly, Sorby<sup>†</sup> was one of the first to make cross-sections of materials such as iron and examine them in the microscope, so that he could relate properties to structure.

\* <http://www.ucmp.berkeley.edu/history/leeuwenhoek.html>

† <http://www.shu.ac.uk/sorby/hcsorby.shtml>

# What is microstructure?

---

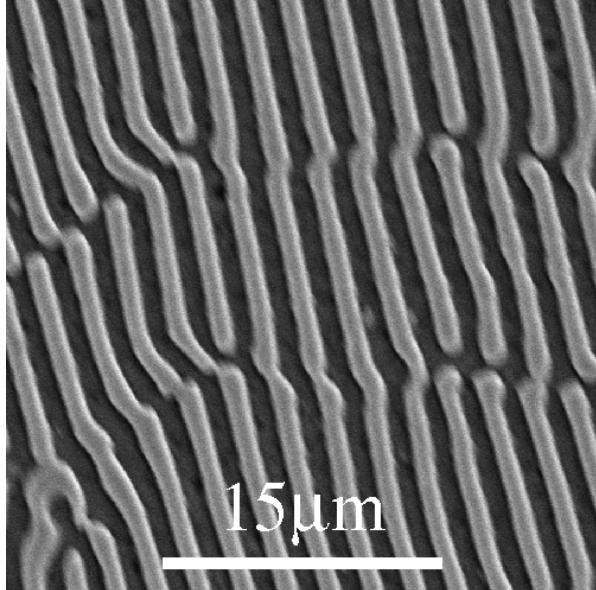

- Microstructure originally meant the structure inside a material that could be observed with the aid of a *microscope*.
- In contrast to the crystals that make up materials, which can be approximated as collections of atoms in specific packing arrangements (*crystal structure*), ***microstructure* is the collection of *defects* in the material.**
- What defects are we interested in?
  - Interfaces (both grain boundaries and interphase boundaries)
  - dislocations (and other line defects)
  - and point defects.
- Since the invention of prefixes for units, the *micrometer* ( $1 \mu\text{m}$ ) happens to correspond to the wavelength of light. Light, obviously is used to form images in a light/optical microscope. Thus *microstructure* has come to be accepted as those elements of structure with length scale of order  $1 \mu\text{m}$ .

# If you look ‘inside’

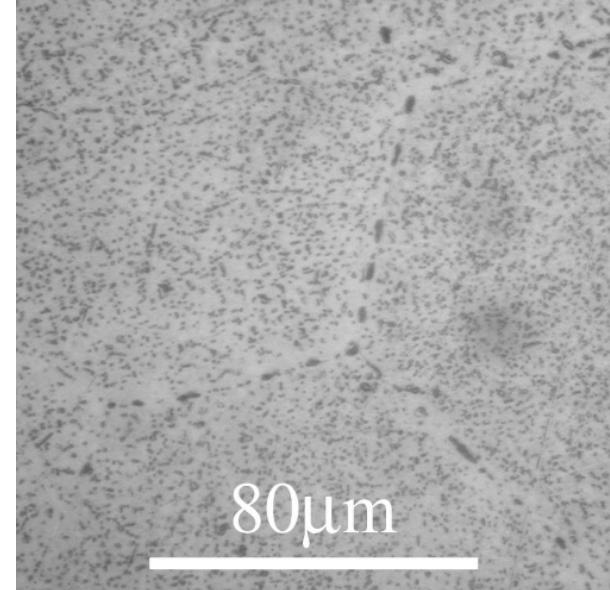

---

Fe-C-X; Hypoeutectic white  
cast iron

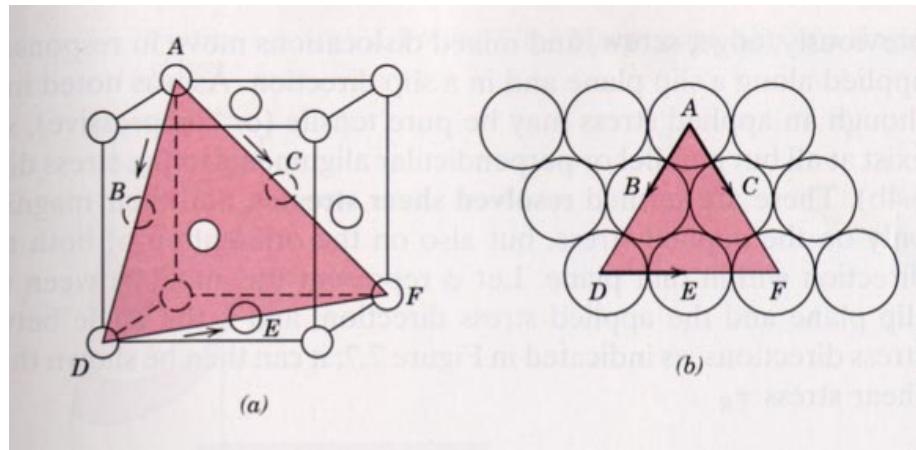

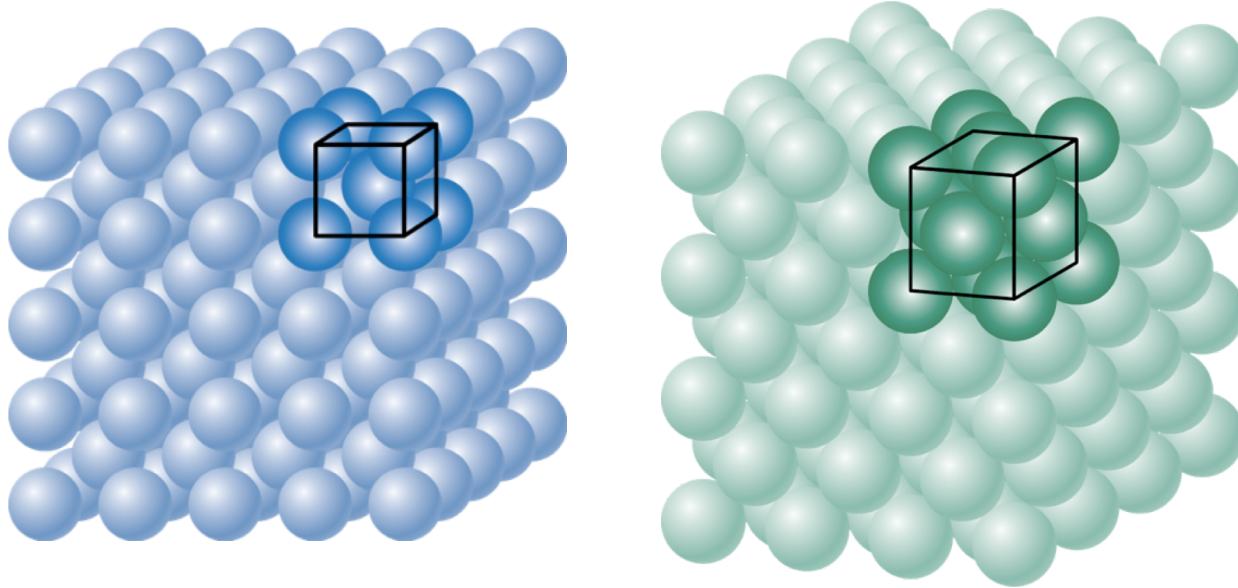

Al 67wt% Cu 33wt%,  
Eutectic alloy

Al 96wt% Cu 4wt%  
Precipitates

# If you look ‘inside’ (crystal structure)

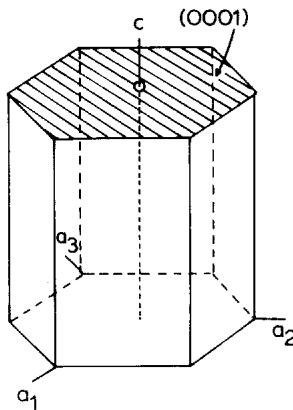

# If you look ‘inside’ (crystal structure)

- HCP is more ‘anisotropic’ than cubic structures.

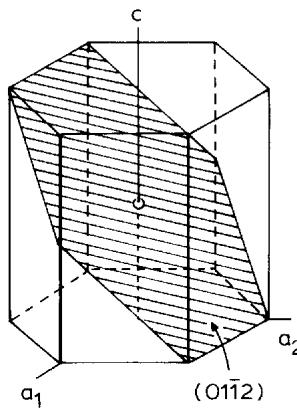

FIG. IV-5—Some important planes in the hcp system and their Miller-Bravais indices.

# Slip systems

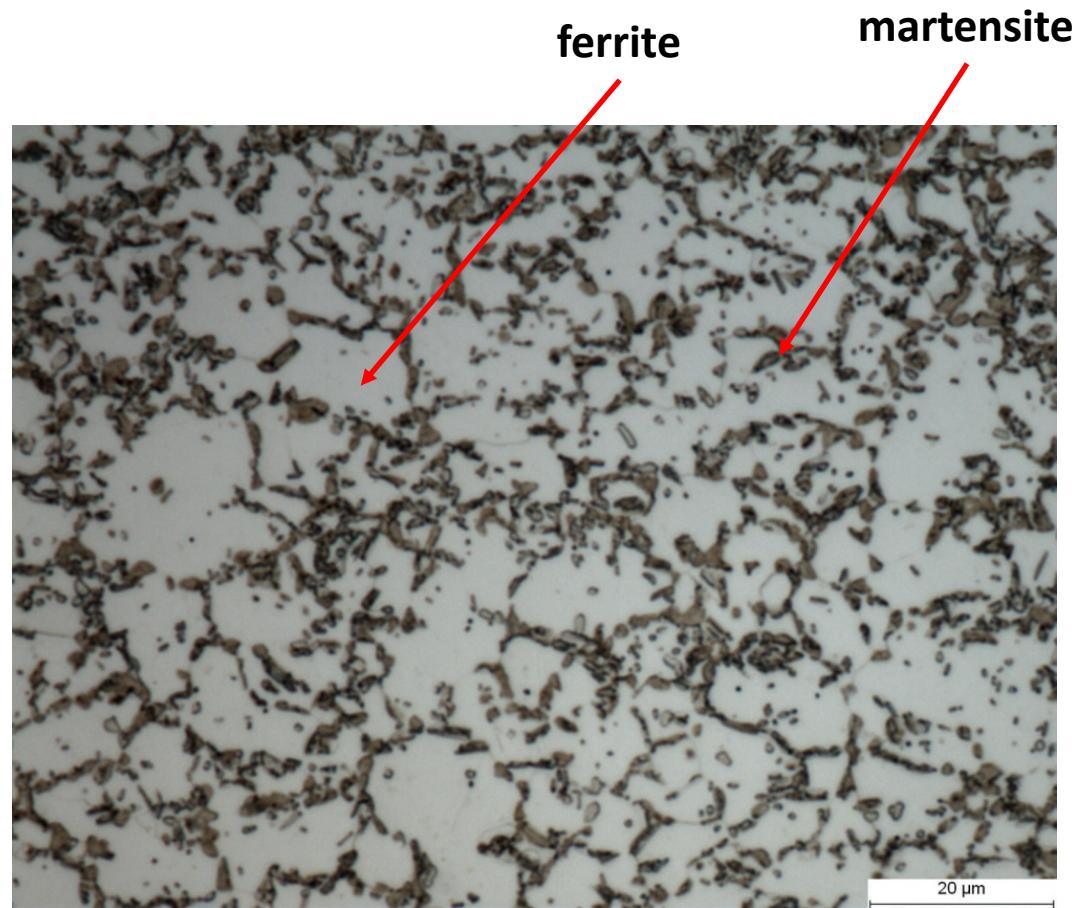

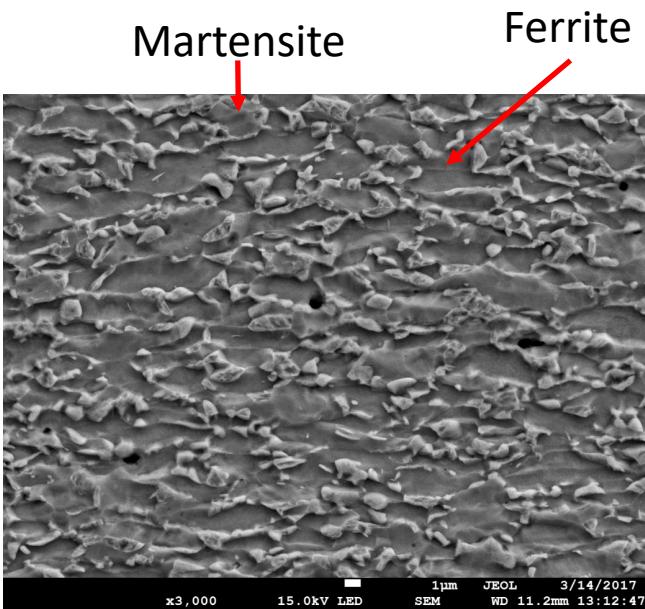

The slip systems for FCC, BCC and hexagonal crystals are:

<i>Metals</i>	<i>Slip Plane</i>	<i>Slip Direction</i>	<i>Number of Slip Systems</i>
<b>Face-Centered Cubic</b>			
Cu, Al, Ni, Ag, Au	{111}	$\langle 1\bar{1}0 \rangle$	12
<b>Body-Centered Cubic</b>			
$\alpha$ -Fe, W, Mo	{110}	$\langle \bar{1}11 \rangle$	12
$\alpha$ -Fe, W	{211}	$\langle \bar{1}\bar{1}1 \rangle$	12
$\alpha$ -Fe, K	{321}	$\langle \bar{1}11 \rangle$	24
<b>Hexagonal Close-Packed</b>			
Cd, Zn, Mg, Ti, Be	{0001}	$\langle 11\bar{2}0 \rangle$	3
Ti, Mg, Zr	{1010}	$\langle 11\bar{2}0 \rangle$	3
Ti, Mg	{1011}	$\langle 11\bar{2}0 \rangle$	6
Also: Pyramidal (c+a) (1 0 -1 1)		$\langle 1 -2 1 3 \rangle$	

Note: In the case of FCC crystals we can see in the table that there are 12 slip systems. However if forward and reverse systems are treated as independent, there are then 24 slip systems.

# If you look ‘inside’ (multiphase)

Modern steels are often multiphase alloys

# Important microstructural features

---

Examples of quantitative microstructural parameters:

Grain size

Void fraction

Aspect ratio of second phase particles or grains

Crystal orientation distribution (crystallographic texture)

# Anisotropy

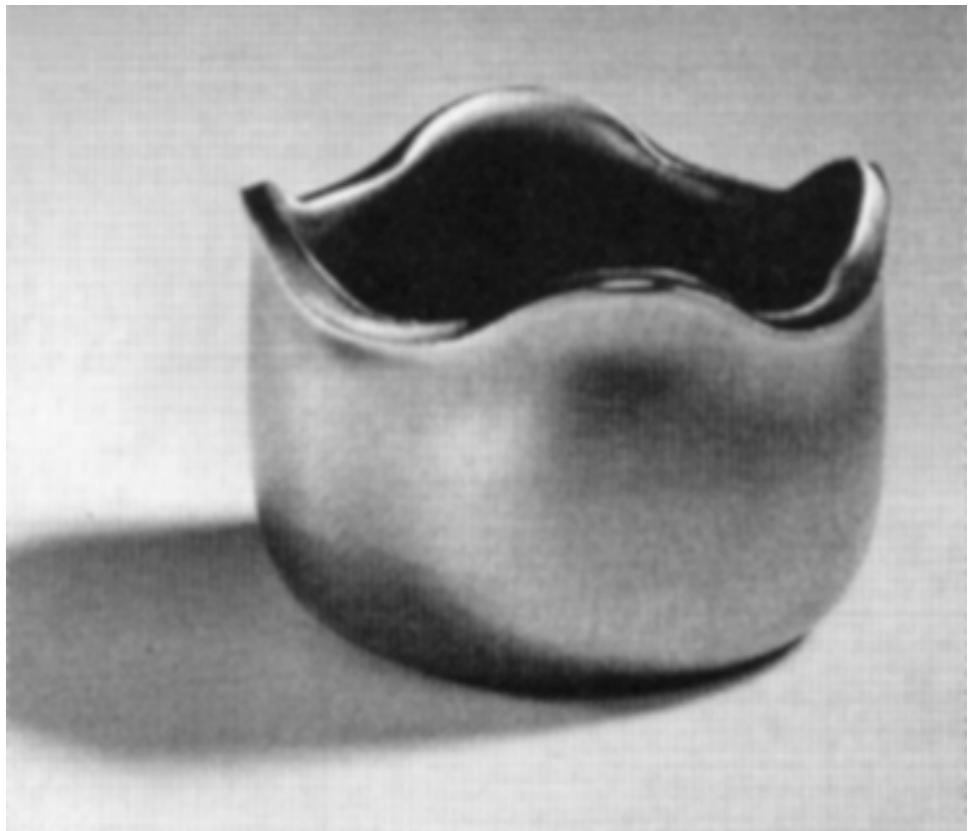

---

- All crystal structure is intrinsically anisotropic.
- Q: Should polycrystalline materials consisting of many crystals anisotropic?
- Q: If not, what makes polycrystal material anisotropic?

# Plastic anisotropy

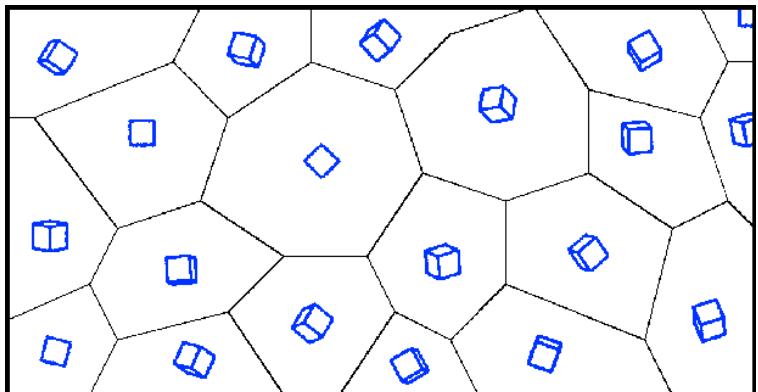

---

Figure shows example of a cup that has been deep drawn. The plastic anisotropy of the aluminum sheet resulted in non-uniform deformation and “ears.”

Randle, Engler, p.340

# Grain orientation

Blue cubes denote unit cells  
representative of the pertaining grain  
bounded by gray lines (Q. What is the  
gray lines here?)

An orientation is a ‘relative term’.  
상대적인 개념. 기준(reference)이  
되는 방향이 갖춰져야 한다.

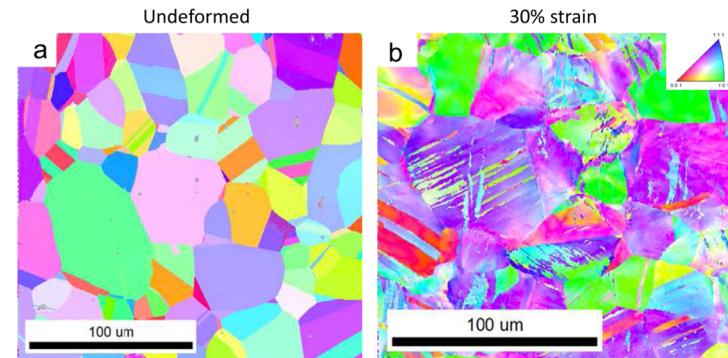

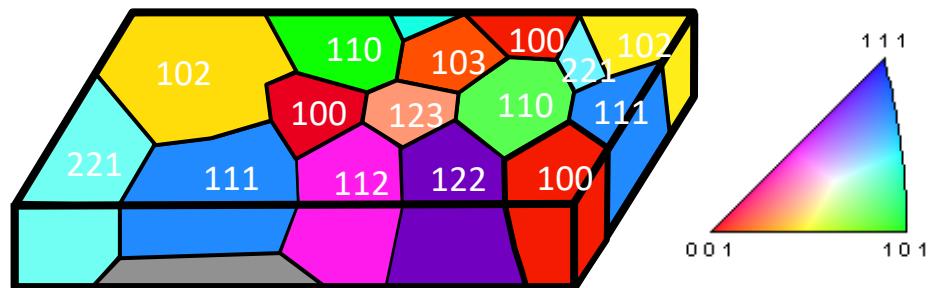

Fig. 1. EBSD orientation map of 304 stainless steel sheet at tensile strains of (a) 0% (undeformed) and (b) 30%.

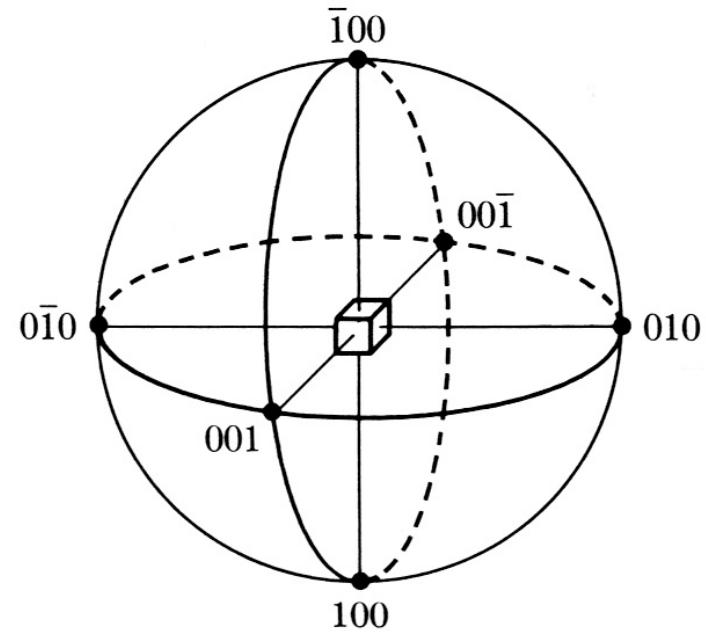

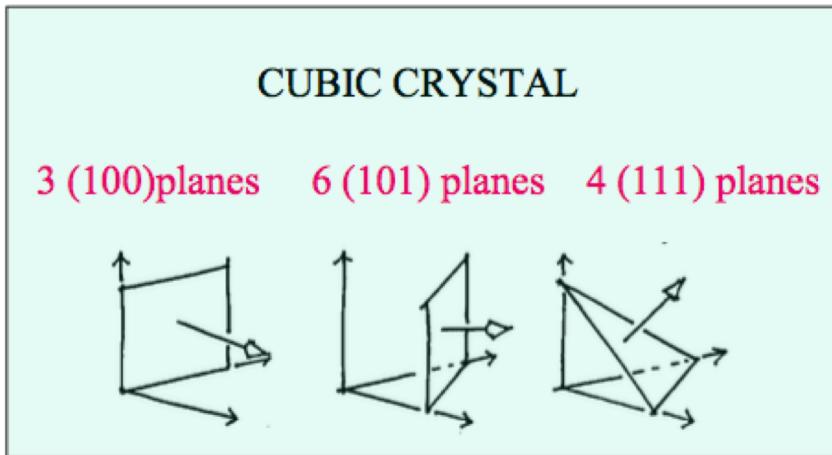

Q. 위 inverse pole figure의 orientation은 color-map으로 표현된다. 사용된 기준은 무엇일까?

# Pole figure and inverse pole figure

X-ray diffraction

Q. Explain Bragg's law

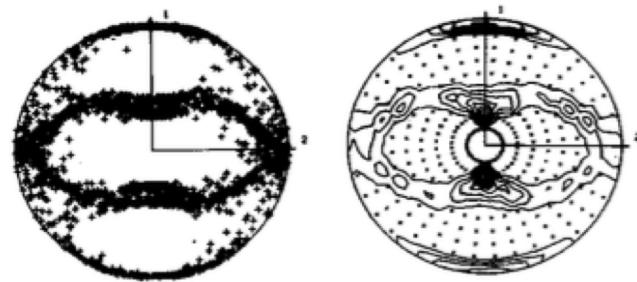

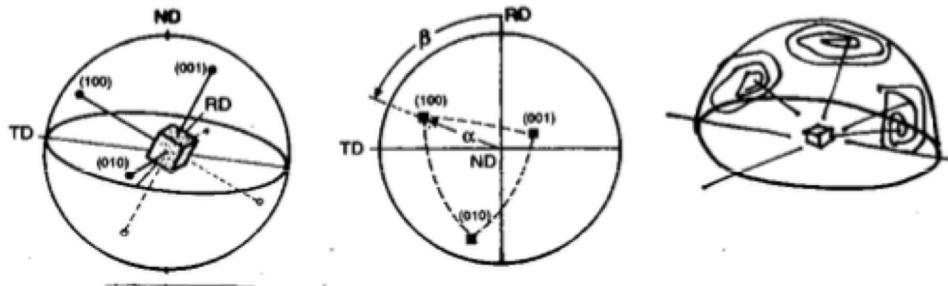

Q. What is Monochromatic X-ray?

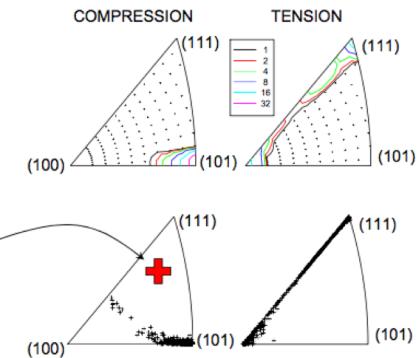

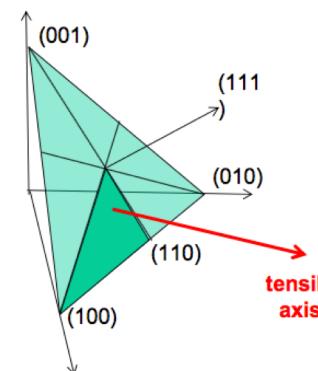

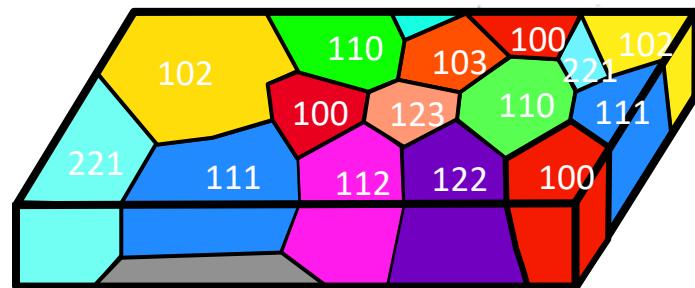

**Fig. 2–25** {100} poles of a cubic crystal.

# Difference between Inv. PF and PF

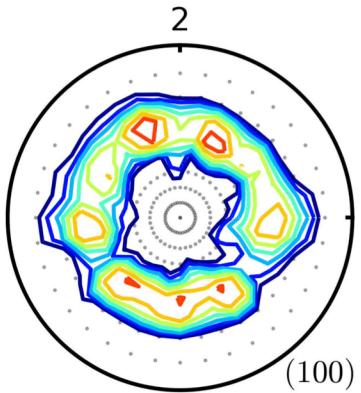

- Relativity. What is the reference and what do you want to visualize

# Recap

---

- How can we determine mechanical properties?
  - Stimulus and Response
- Pros and cons of metal forming
- How polycrystalline material can be ‘isotropic’?
- What is crystallographic texture?
- What is inverse pole figure and pole figure?
- Can we have a type of new material that is best for everything? If not, why?
